A Conversation Between Two Powerhouse Women

What happens when two powerhouse women, whose grassroots-turned-global environmental organizations have been intertwined for decades, sit down to talk? Two women who have been helping communities with saving of ancestral, integrative, and holistic ways they and their land, sea, and air relate to each other.

March 8, Grazia Borrini-Feyerabend, **co-founder and Honorary Board Coordinator of the ICCA Consortium**, in conversation with Dr. Luisa Maffi, **co-founder and Executive Director of Terralingua**.

Physics? Easier Than It Seemed

Luisa: There's a well-known saying that goes "Anthropology is the science of common sense" and that is what I did with a BA. Similarly, when I had just moved to Denmark and was in anthropology, I was told that anthropology is the science of the obvious. I thought, "Oh, that's what I'm doing, I'm studying the obvious."

Grazia: And I've been starting to observe people in their environment and to ask questions about why they were behaving, however, I wanted to understand how the world works. I was fascinated by physics and I thought that physics would explain everything. I was very disappointed when I found out that physics was hard because I'm not very good at mathematics. I was not good enough to be a physicist, but I discovered that physics was not as complicated as I thought it was. I was very much into nature, people going hungry, forms of beggary in Asia and I wanted to understand why these things were happening and what could be done about it.

When we met at Stockholm, Luisa, I had already met Professor Kristian Bjorkqvist, who later established the University of Vaasa's Center for Peace Studies. Firstly, he was known, but Secondly, I was very much into peace studies and I was very much into nature. I was very much into the idea that there is a basic human need, I have been saying this with all of the students of conflict studies and development studies.

Grazia Borrini-Feyerabend and Luisa Maffi in Kuala Lumpur, Malaysia, 2019

Luisa: Yes. I remember you were quite critical of "mainstream ethics" in the science I studied. I don't know if you remember, but I remember you were quite critical of the ethics of science. I was also into the thinking, however, I wanted to believe that science was ethical. I wanted to believe that science was good.

Grazia: To be harmless. Partly your supporting me to work on interdisciplinary initiatives, to create a study on the ethics of science and to organize a lot of workshops. Eventually, I found out that I was not good enough to be a physicist, but I was good enough to be a peace researcher. Public health [was] a strategy that the World Health Organization was pushing toward Health for All by the Year 2000. I was very much into primary health care, which was the idea that health is a matter of socioeconomic, political, and environmental quality of life.

Luisa: That's really interesting! While doing my Bachelor's in Chapel, I was learning from Mayan healers and I was also learning from Mayan farmers. I was learning about their ethnobotanical knowledge and it made me passionate for health and well-being of them.

Community Self-determination for Health and the Integrity of Nature

Grazia: Those subjects were ripe, were they not? The discussion of Alma-Ata had taught me that the health of the people depended on the health of the environment. Health was not a matter of medicine, it was a matter of self-determination, of public health, and well-being and the rest. And the world in the air, my students at the Wilderness Society, and I were very much into nature conservation.

When I moved back to Italy working at the Italian Federation of Nature Protected Areas, I was put in charge of the section of international cooperation and I was supposed to help countries in Africa, Asia, Latin America, and Eastern Europe to establish protected areas. I was very much into the idea that protected areas were a way to protect nature, but also to protect the rights of people who were living in those areas. I was very much into the idea that people were living in those areas and they were living in those areas because they had been living in those areas for many generations.

Grazia Borrini-Feyerabend and Luisa Maffi in Kuala Lumpur, Malaysia, 2019

Luisa: Yes. It was the heyday of UNCED, the Rio Summit, when new programs to the environment were being established left and right.

Grazia: Those years were also the time when I was first exposed to the concept of ICCAs. I was told about them by Stan Stevens, who was working for the World Wildlife Fund. They were just very few, but I figured out: oh, this would be the IUCN's perspective. Strategy, the policy perspective, and the practice.

And the result was the creation of a small environmental unit, the **International Center for Conservation of Nature (ICCN)** that was, in the 1990, to set up as Social Science Programs. The Center for Conservation of Nature (ICCN)
